Wire, Cable & Hose Management

Product:

VNH-23 Cable Jacket

Problem:

Cable and hose management at private yacht marinas has always been a big problem from a trip hazard and environmental exposure standpoint. A simple to use and rugged jacketing system was needed that could be modified on site to fit the numerous cable combinations common with boat slips. A system to manage these lines and hoses was needed to cleanup the look of the docks, minimize the trip hazard, protect the high voltage lines from the saltwater environment and reduce the marina and boat owners associated insurance liability.

Solution:

A wrap around jacket of abrasion and weather resistant Nylon reinforced PVC in various sizes and lengths solved the organizational, abrasion, weather and liability problems. A standard Zippertubing jacket type with an extruded closure made it easy to install and fit to length on site. Installation was accomplished using only a pair of scissors and a Z-Track plier tool. Combining these hoses and lines into a single common jacket yielded solved all of the application requirements.

Material:

Zippertubing's standard [VNH-23](#), Nylon reinforced PVC coated material configured with Zippertubing's classic heat welded and water resistant [Z-Track closure](#). In addition, Zippertubing's [ZT-Tape-8235](#) was used to seal the "Y" breakout overlap areas.

Conclusion:

The Zippertubing solution easily solved all the cable management and environmental issues while providing a cost effective solution. The marina and yacht owners reduced their liability exposure and benefited from reduced insurance rates.
