

“SLM” Slider Tool

The **SLM** tool is a Stainless Steel slider tool designed for closing Zippertubing M-Track products. It is required for all M-Track installations. The M-Track closure looks similar to the smaller R-Track and S-Track closures, but M-Track's physical size and high engage force demands a high strength engagement tool like the SLM. Track closure is achieved by inserting the upper and lower halves of the track interlock into the tool and then sliding the SLM tool down the cable run. Sliding the SLM tool along the cable forms the M-Track jacket around the cable harness and snaps it together to form a continuous tube.

Refer to Zippertubing's operation instruction document ZT07-98-001 to learn how to use this tool.
